

Jimmy Guzman Moreno

Minneapolis, MN | hi@jimmy.codes | jimmy.codes

Staff Engineer | Full-stack architecture, distributed systems | React, TypeScript, Node.js

Staff-level engineer focused on full-stack architecture, distributed systems, and platform design at enterprise scale. I shape cross-team technical direction, modernize legacy systems, and build developer platforms that help engineering orgs ship faster.

What I bring

- Designed NX and Turborepo monorepo architectures supporting 15+ teams across frontend and backend services, enabling independent deployments and cutting cross-team friction
- Owned multi-year technical roadmap for a large supply chain domain, sequencing modernization and architectural evolution across a broad surface area
- Led AngularJS-to-React transformation across supply chain systems, killed waterfall data-loading patterns, improved load times by 75% without service disruption
- Architected and delivered a distributed pre-order pickup capability integrating REST APIs and event-driven workflows; company-wide adoption within one month
- Defined and built microservice platform architecture enabling UI teams to rapidly ship APIs through standardized scaffolding, shared patterns, and integrated CI/CD
- Re-architected CI/CD pipelines, dropping build times from 30+ minutes to 5 minutes (83% reduction), speeding up delivery across product teams
- Built an enterprise React component library and engineering standards adopted by 15+ teams
- Cut API latency by 70% and improved frontend rendering performance by 75% through architectural and backend optimizations
- Mentored 50+ engineers across teams; multiple promoted to Senior and Lead roles

Technical skills

- **Frontend:** React, Next.js, Astro, React Router
- **Languages:** TypeScript, JavaScript, Python, Java, Kotlin, Groovy
- **Backend and APIs:** Node.js (Express, Fastify), Bun (Hono), GraphQL, REST, Kafka, PostgreSQL, MongoDB, Redis, Prisma, Drizzle
- **AI engineering:** LangChain, Agno, OpenAI API, Claude Code, opencode, multi-agent systems, ReACT, prompt engineering, RAG
- **Platform engineering:** Vite, Turborepo, NX, webpack, Rollup, GitHub Actions, Jenkins, Docker, Infrastructure as Code
- **Testing and observability:** Vitest, Playwright, Jest, Cypress, Testing Library, Mock Service Worker, OpenTelemetry, Grafana
- **Developer experience:** Monorepo architecture, build optimization, static analysis, performance engineering, feature flagging

Experience

AI Engineering Fellow

Overclock Accelerator | Mar 2026 – Present

- Taking part in an intensive training fellowship for experienced software developers and leaders on AI Engineering
- Key focus areas: AI-Accelerated Software Engineering, Prompt and Context Engineering, AI Application Development, Workflows, and Multi-Agent Orchestration
- Building products with LLM APIs (OpenAI, Anthropic, Gemini) along with agentic development frameworks like LangChain and Agno
- Delivering a capstone multi-agent application as final project

Lead Engineer, Supply Chain Technology

Target | Jan 2021 – Present

Technical strategy and architecture

- Owned multi-year technical roadmap for a large supply chain domain spanning numerous capabilities, sequencing modernization across a broad surface area
- Contributed to company-wide technical hiring strategy through the Tech Case Study Working Group, collaborating with Principal Engineers and Directors
- Defined the AngularJS-to-React migration strategy across supply chain systems, establishing architectural patterns adopted organization-wide
- Designed full-stack distributed systems supporting high-volume inventory and fulfillment operations
- Drove TypeScript standards and modern development practices, reducing production defects by 40%

Platform engineering and developer experience

- Re-architected CI/CD pipelines, reducing build times by 83% and improving developer velocity
- Implemented Turborepo-based monorepo architecture enabling independent deployments and shared libraries across frontend and backend services
- Migrated dependency management to pnpm, resolving version conflicts and improving installation performance
- Re-architected frontend build and testing toolchain, introducing modern bundling, testing, and static analysis infrastructure that sped up feedback loops and reduced CI friction
- Built a centralized engineering knowledge system capturing architectural decisions, design artifacts, and technical investigations, improving institutional memory and onboarding
- Established component-driven development as the default frontend architecture using Storybook, codifying reusable UI patterns and cutting time to market
- Spearheaded agentic development practices using Claude Code and opencode, establishing prompting patterns, guardrails, and reusable workflows that accelerated everyday engineering tasks across the team

System architecture and delivery

- Architected and delivered a distributed pre-order pickup capability integrating REST APIs and event-driven workflows; Target-wide adoption within one month
- Re-designed frontend routing and data-loading architecture during React Router migration, eliminating waterfall patterns and reducing load times by 75%
- Designed batch query APIs that cut response times by 70%

- Led migration from Sequelize to Prisma, improving database performance, type safety, and maintainability
- Built proof-of-concept backend architecture addressing scalability challenges in distributed item data retrieval
- Designed Key Activation Service, accelerating mainframe decommissioning by six months
- Developed Next.js proof of concept enabling internal design system compatibility with App Router
- Defined and built microservice platform architecture enabling UI teams to rapidly deliver APIs through standardized service scaffolding, shared patterns, and integrated CI/CD workflows

Organizational impact

- Led full-stack engineering team supporting multiple applications, APIs, and databases critical to supply chain operations
- Led a from-scratch rebuild of an agentic AI platform application in one week, selecting the tech stack, enabling safe prompt engineering patterns, and coaching the team through SSR/SSG design decisions
- Mentored engineers across teams, resulting in multiple promotions to Senior and Lead roles
- Mentored engineers on agentic development with Claude Code and opencode, pairing on real workflows to raise AI fluency and developer velocity across the team
- Served as security champion for a supply chain UI portfolio, driving cross-team initiatives including GitHub cloud migration, OpenTelemetry adoption, and software composition analysis (SCA) vulnerability reduction
- Led technical interviews and contributed to evaluation frameworks as Talent Captain
- Partnered with UX to establish a scalable design system across supply chain applications
- Partnered with leadership to transition team from Scrum to Kanban, improving delivery flow and predictability

Senior Lead Engineer

Ameriprise | 2018 – 2021

Platform architecture and modernization

- Led full-stack development for guest access platform using Java and React
- Led frontend engineering team through CMS transition, establishing architectural standards and delivery practices
- Built enterprise React component library adopted across 15+ teams
- Architected NX monorepo enabling independent deployments and optimized CI/CD pipelines
- Led Engineering Standards Committee defining frontend best practices organization-wide
- Built internal tooling platform standardizing frontend builds and reducing setup time by 75%
- Pioneered organization-wide end-to-end testing strategy using TestCafe, integrating automated E2E coverage into CI/CD pipelines and improving release confidence
- Partnered in organization-wide Agile transformation, co-defining engineering maturity model to align delivery standards, technical quality, and team scalability

System modernization and delivery

- Consulted across multiple teams and finance domain projects, elevating frontend practices and technical quality organization-wide

- Accelerated Riot.js-to-React migration across the organization by establishing best practices, component architecture standards, and a shared design system that paved the way for teams to adopt React independently
- Drove TypeScript adoption organization-wide by building migration tooling, authoring internal guides, and running hands-on workshops for engineering teams
- Architected a GraphQL Node.js backend-for-frontend proof of concept to evaluate service composition, reduce client-side data complexity, and inform long-term API strategy
- Designed API-driven application architecture improving frontend-backend integration and scalability
- Architected CI/CD pipelines improving release confidence across product teams

Freelance Web Developer

2016 – 2018

- Built responsive web applications for small businesses
- Improved performance and accessibility, increasing conversion rates
- Implemented SEO strategies that improved search visibility and organic traffic

Education

California State University, Fresno – Computer Engineering Treehouse – Front End Techdegree
